As unemployment has risen throughout the world, governments have become more focused on protecting their own industries than on promoting international commerce. The U.S., though typically an enthusiastic supporter of open markets, in duded "buy American" clauses in its stimulus package and propped up its failing auto industry with handouts.

But according to the Asian Development Bank (ADB), in the part of the world that was hit hardest by the trade crash Asia, the number of Free - Trade Agreements (FTAs) signed by Asian countries has grown from just three in 2000 to 56 by the end of August 2009. Nineteen of those FTAs are among 16 Asian economies, a trend that could help the region become a powerful trading bloc.

The drive to lower trade barriers has taken on *fresh* urgency amid the recession. As Asian manufacturing networks become more interwined - and as Asian consumers become wealthier - regional commerce is becoming *critical* to future economic expansion. Intraregional trade last year made up 57% of total Asian trade, up from 37% in 1980. In the past Asian produced for America and Europe, now Asia is producing for Asia.

Of course, Asia is still dependent on sales to the West. But FTAs could reduce the region's exposure to the United States by giving Asian companies preferential treatment in selling to Asian companies and consumers. These benefits could come with downsides, however. According to experts, FTAs create a 'non-level playing field with advantages for Asian countries'. If the most dynamically growing part of the global economy gives the U.S. restricted access it will impact global balance. Companies in countries like the United States left out of the trade pacts could face disadvantages when trying to tap fast - growing Asian markets. This, in turn, could have a negative impact on efforts to rebalance excessive debt in the U.S. and excessive savings in Asia. Still, the benefits of greater regional integration could prove powerful enough to over-come the roadblocks. In Asia, the only thing everyone agrees upon is business. If it does, the world economy may never be the same.

Seed quality is an (96) aspect of crop production. For ages, farmers have traditionally been selecting and (97) good quality seed, since it was in their interest to do so. They knew and understood the importance of quality seed in production.

However, with the advent of green revolution technology, based (98) on the high yielding dwarf varieties of wheat, and rice, mainstream thinking changed. Agricultural scientists, for reasons that remain (99), began to doubt, the ability of farmers to maintain seed quality (100). Aided by the World Bank, the Ministry of Agricultural launched a National Seeds Project in 1967. Under the project spread into three phases, seed processing plants were (101) up in nine states. Six states were covered under phase three. All that the huge processing plants were (102) to do was to provide 'certified' seeds of food crops, mainly self-pollinating crops, to farmers. In mid - 1980s, the International Rice Research institute (IRR) in the Philippines
concluded a study which (103) that there was hardly any difference in the crop yields from transplanted rice and from the crop sown by broadcasted seeds. One would wonder why, in the first instance, were the farmers, asked to (104) over to transplanting paddy? The answer is simple - probably, to help the mechanical industries grow. Since, rice, is the staple food in Asia, tractor sales could only grow if there was a way to move the machine in the rice fields. No wonder, the sales of tractors, puddlers, reapers and other associated (105) soared in the rice growing areas.
